Collaboration Opportunities

We partner in innovative research

Overview

The Advanced Technology Group is involved in many collaborative relationships with university researchers and leading-edge standardization groups. The goal of such collaboration is to increase the body of storage-related knowledge, and to promote the development of new innovative storage-related technologies.

Internships

ATG hosts graduate student interns to work on interesting and innovative projects with regular mentoring and collaboration from ATG engineers. Intern projects usually align the student's interest with a current ATG project or trend and target publication in a top conference. Positions are typically during the summer in the US, and for six months, twice a year in India.

Consortiums

ATG invests in university research consortiums where the agenda aligns with the interests of NetApp. Multi-year memberships allow sustained support for a university's research program to reach its more aggressive research goals. Support from NetApp takes the form of advising and collaborating, as well as financial funding.

Grants

A NetApp Faculty Fellowship (NFF) is another way ATG supports university research. NFF grants are awarded based on a submitted proposal's research merit, and NetApp's interest in the proposed project. NFFs are typically one year engagements that involve funding, and have ATG members dedicated to follow the research progress and sometimes collaborate with the research team.

University Day

ATG holds an annual event in the US and in India that brings the top storage researchers together with NetApp researchers to discuss the latest trends impacting the storage industry.

KEY FACTS & FIGURES	
5	Consortiums
15+	Active Fellowships
20+	Interns per year
40+	University Day Guests
