A NetApple a day keeps the data doctor away

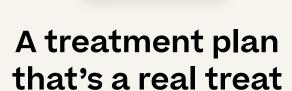

They say the best cure is prevention, and we couldn't agree more. With immutable, indelible data copies and malicious file screening, your data gets regular checkups, without affecting performance, so you can block bad actors in moments, defend against unauthorized accounts, and get back to peak data shape if your system comes down with something icky.

Detect

With modern diagnostic tools,
NetApp proactively identifies threats
to the system by discovering storage
performance abnormalities as they
occur and drawing attention to
unexpected user behavior as it
happens. Not to mention, we've got
the best bedside manner in the biz.

Recover

All those data checkups are about to pay off. You'll be able to restore petabytes in minutes from local or remote copies, getting your data up and at em in no time. Add in end-to-end, tamper-proof audit trails and granular file restoration for any user, anywhere, and you've got the ultimate treatment plan for any disease plaguing your data.
